Highly Crosslinked Polyethylene in Total Hip Arthroplasty Decreases Long-term Wear: A Double-blind Randomized Trial

Method
Fifty-four patients were randomized to receive hip arthroplasties with either UHMWPE liners or HXLPE liners. Three-dimensional penetration of the head into the socket was determined at 10 years using a radiostereometric analysis system.

Results
At 10 years
HXLPE 0.003 mm/year, volumetric penetration was 98 mm³
UHMWPE 0.030 mm/year, volumetric penetration was 14 mm³

Conclusion
HXLPE has little detectable steady-state in vivo wear. This may result in fewer reoperations from loosening.
The Otto Aufranc Award:
Modifiable versus Nonmodifiable Risk Factors for Infection After Hip Arthroplasty

Guy Maoz MD, Michael Phillips MD, Joseph Bosco MD, James Slover MD, MS, Anna Stachel MPH, Ifeoma Inneh MPH, Richard Iorio MD
Methods
A series of 3672 primary and 406 revision hip arthroplasties performed at a single specialty hospital over a 3-year period were reviewed.

Results
BMI $\geq$ 40 kg/m$^2$
operating time > 115 minutes
nonsame-day surgery
revision surgery
Tobacco use and $S$ aureus colonization were additive risk factors

Discussion
Modifiable risk factors in our patient population include operating time, elevated BMI, tobacco use, and $S$ aureus colonization. When reporting deep PJI rates, stratification into preventable versus nonpreventable infections may provide a better assessment of performance on an institutional and individual surgeon level.
One Size Does Not Fit All: Involve Orthopaedic Implant Patients in Deciding Whether To Use Prophylactic Antibiotics With Dental Procedures.

1. High-strength evidence suggests that antibiotic prophylaxis reduces the incidence of post-dental procedure–related bacteremia, but there is no evidence that bacteremia increases the risk of PJI.
2. Oral topical antimicrobials
3. Maintenance of good oral hygiene.
MANAGEMENT OF HIP FRACTURES IN THE ELDERLY
AAOS CPG

• Strong evidence supports regional analgesia to improve preoperative pain control in patients with a hip fracture.
• Moderate evidence supports a benefit to total hip arthroplasty in properly selected patients with unstable (displaced) femoral neck fractures.
• Moderate evidence supports the preferential use of cemented femoral stems in patients undergoing arthroplasty for femoral neck fractures.
• Moderate evidence supports higher dislocation rates with a posterior approach in the treatment of displaced femoral neck fractures with hip arthroplasty.
• Strong evidence supports a blood transfusion threshold of no higher than 8g/dL in asymptomatic postoperative hip fracture patients.
• Strong evidence supports multimodal pain management after hip fracture surgery.
